                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T 3'), on equal amounts of mRNA from 2 13.5dpc and 2
State Univ., from 2 1; double-stranded by Minoru Ko, Wayne
State Univ., from 2 1; double-stranded cDNA was ligated th
Eco RI adaptors (Pharmacia), digested with Not I and
cloned into the Not I and Eco RI sites of the modified
pT/T3 vector. Library went through one round of
normalization, and was constructed by Bento Soares and
M.Fatima Bonaldo.

3'), on total mouse RNA [provided by Minoru Ko, Wayne State Univ.]; double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. Library went through one round of normalization, and was constructed by Bento Soares and M. Fatima Bonaldo. "

Title: Perfect score: Sequence:

1 occaccottotcatoggoto.....atgggtogaaaaggoggga 834

IDENTITY_NUC Scoring table: 311585 seqs, 125096042 residues Searched:

N_Geneseq_36:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New isolated haemopoietin receptor - used for developing products

To includating proliferation, differentiation and survival of cells,

e.g. neuronal cells

Example 8; page 99-100; 183pp; English.

NR 6 is a novel haemopoietin receptor (HR). Interaction between the novel

HR and a ligand facilitates proliferation, differentiation and survival.

Cof a wide variety of cells: The HR and it's derivatives can be used for

modulating the activity of the receptors e.g. to requiate development,

maintenance or regeneration in an array of different cells and tissues in

vitro and in vivo. They can be present in therapeutics used for

modulating neuronal proliferation, differentiation and survival. The

condulating neuronal proliferation, differentiation and survival. The

condulating neuronal proliferation and survival. The

conducts can also be used for detection and diagnosis, e.g. for cancers

or predisposition to cancers, or for drug screening.

Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it/s to require development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in the repetutes used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, sequence 1629 BP; 336 A; 541 C; 453 G; 299 T;

the haematopoietin receptor superfamily, used in the method of the invention for the modulation of cell proliferation, or the immune response. Transformed mammalian cells are used to produce recombinant U4 protein. The U4 protein is used to screen for specific binding agents, raise antibodies. It is also used as reagents for assays and as tissue markers for isolation of compate ligands and receptors, and in pharmaceutical compositions which may modulate cell proliferation, cell differentiation, and the immune system (e.g. for treating immune deficiency, inherited or the result of infection, autoimmune diseases, sequence 1656 BP; 318 A; 552 C; 478 G; 308 T;

The present sequence encodes a protein designated Zcytor5, which is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-l in the blood, and to discover other possible Zcytor5 ligands. A probe and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the therapeutically to modify Zcytor5 ligand effects.

Disciosure, Page 68-70; 55pp; English.

The present sequence encodes an allelic varaint of protein designated 2cytors, which is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17-MAR-1999 (first entry)

CDNA encoding an allelic varaint of human 2cytor5.

Zcytor5, cytokinin-11ke receptor; down-regulation; growth factor; maintenance factor; thyroid; heart; skeletal. muscle; cardiotrophin-1; cardiac pathology; heart enlargement; Zcytor5 ligand; allelic varaint;
New mammallan cytokinin-like receptor Zcytor5 - useful for, e.g. down_regulating Zcytor5 natural ligands or detecting cardiotrophin-1

```
New nucleic acid encoding U4 haematopoietin receptor superfamily chain - potentially useful, e.g. for modulating cell proliferation or immune response, for treating cancer and auto:immune disease claim 1; Page 28; 38pp; English.

Claim 1; Page 28; 38pp; English.

Chis is the nucleotide sequence encoding the human U4 protein from the haematopoietin receptor superfamily, used in the method of the invention for the modulation of cell proliferation, or the immune response. Transformed mammalian cells are used to produce recombinant U4 protein. The U4 protein is used to screen for specific binding agents, raise antibodies. It is also used as reagents for assays and in pharmaceutical compositions which may modulate cell proliferation, cell differentiation, and the immune system (e.g. for treating immune deficiency, inherited or the result of infection, autoimmune diseases, sequence 1579 BP; 304 A; 535 C; 473 G; 257 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 340

CDNA encoding human Zcytor5.

2cytor5; cytokinin-like receptor; down-regulation; growth factor;
maintenance factor; thyroid; heart; skeletal muscle; cardiotrophin-1;
cardiac pathology; heart enlargement; 2cytor5 ligand; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Discuslate, raye as or, aspy, musting.

The present sequence encodes a protein designated Zcytor5, which is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.

The NRG gene encodes a novel Haemopoietin receptor (HR). Interaction between the novel HR and a lighand facilitates proliferation,

differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or of rary screening.

New isolated haemopoletin receptor - used for developing products for modulating proliferation, differentiation and survival of cells.

For modulating proliferation, differentiation and survival of circles. Present the movel haemopoletin receptor (HR). Interaction between the novel NR6 is a novel haemopoletin receptor (HR). Interaction between the novel NR6 is a novel haemopoletin receptor (HR). Interaction and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors of ifferentiation and survival maintenance or regeneration in an array of different cells and tissues in control in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.
                                                                                                                                               V27159;
29-SEP-1998 (first entry)
PCR product for human NR6.

T for modulating releases

T e.g. neutonal calls

Claim 9; Fig 3; 182pp; English.

Claim 9; Fig 3; 182pp; English.

C between the novel HR and a ligand facilitates proliferation,

differentiation and survival of a wide variety of cells. The HR and it's

C derivatives can be used for modulating the activity of the receptors e.g.

CC different cells and tissues in vitro and in vivo. They can be present in

CC therapeutics used for modulating neuronal proliferation, differentiation

CC therapeutics used for modulating neuronal proliferation, differentiation

CC and survival. The products can also be used for detection and diagnosis,

CC e.g. for cancers or predisposition to cancers, or for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Claim 8 Page 108-114; 182pp; English.

The NR6 gene encodes a novel Haemopoletin receptor (HR). Interaction between the novel HR and a ligand facilitetes proliferation, differentiation and survival of a wide variety of cells. The HR and it's products can be used for modulating the activity of the receptors e.g. to requiste development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.

New mammalian cytokinin-like receptor Zcytor5 - useful for, e.g.
down-regulating Zcytor5 natural ligands or detecting cardiotrophin-l
in blood

Example 1; Page 77; 55pp; English.

RL, Foster DC, Gilbert T, Jelmberg AC, Lehner JM, Presnell SR, Whitmore TE;

```
The present sequence represents an expressed sequence tag (EST) used to identify CDNA encoding a protein designated Zcytor5, which is a cytoKinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-l in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.

ö,
                                                                                                                                                    The present sequence represents an expressed sequence tag (EST) used to identify cDNA encoding a protein designated zcytor5, which is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify zcytor5 and therapeutically to modify Zcytor5 ligand effects.

14.5dpc embryos [total RNA provided by Minoru Ko, Wayne State Univ., from 2.]; double-stranded cDNA was ligated becord adaptors (Pharmacla), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization, and was constructed by Bento Soares and M. Falina Bonaldo.
